Introduction to Sockets Programming in C using TCP/IP

Professor: Panagiota Fatourou
TA: Eleftherios Kosmas
CSD - May 2012

Introduction

- Computer Network
 - hosts, routers, communication channels
- **Hosts** run applications
- **Routers** forward information
- **Packets**: sequence of bytes
 - contain control information
 - e.g. destination host
- **Protocol** is an agreement
 - meaning of packets
 - structure and size of packetse.g. Hypertext Transfer Protocol (HTTP)

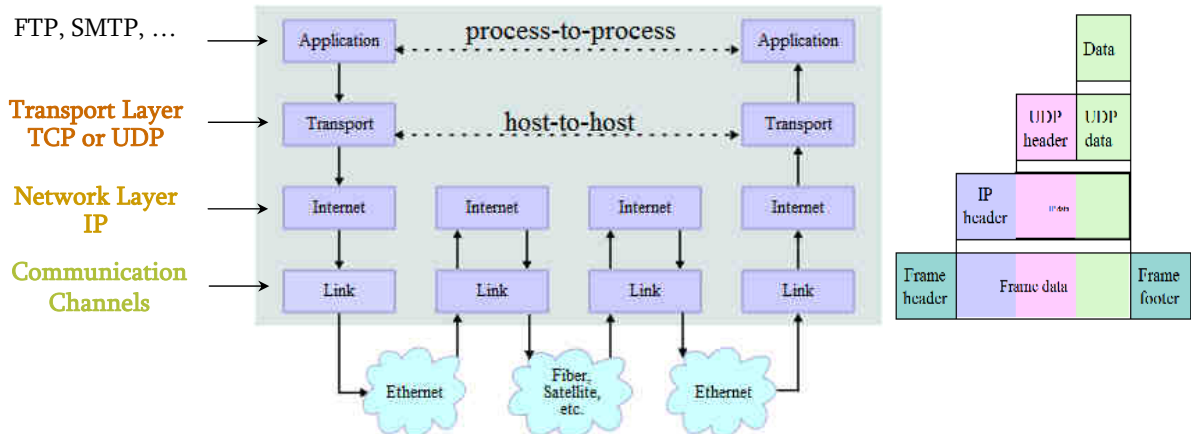

TCP/IP

Network Topology

Data Flow

* image is taken from "http://en.wikipedia.org/wiki/TCP/IP_model"

Internet Protocol (IP)

- provides a **datagram** service
 - packets are handled and delivered independently
- **best-effort** protocol
 - may lose, reorder or duplicate packets
- each packet must contain an **IP address** of its destination

TCP vs UDP

- Both use **port numbers**
 - ❑ application-specific construct serving as a communication endpoint
 - ❑ 16-bit unsigned integer, thus ranging from 0 to 65535
 - ☞ to provide **end-to-end** transport
- UDP: User Datagram Protocol
 - ❑ no acknowledgements
 - ❑ no retransmissions
 - ❑ out of order, duplicates possible
 - ❑ connectionless, i.e., app indicates destination for each packet
- TCP: Transmission Control Protocol
 - ❑ reliable **byte-stream channel** (in order, all arrive, no duplicates)
 - similar to file I/O
 - ❑ flow control
 - ❑ connection-oriented
 - ❑ bidirectional

TCP vs UDP

- TCP is used for services with a large data capacity, and a persistent connection
- UDP is more commonly used for quick lookups, and single use query-reply actions.
- Some common examples of TCP and UDP with their default ports:

DNS lookup	UDP	53
FTP	TCP	21
HTTP	TCP	80
POP3	TCP	110
Telnet	TCP	23

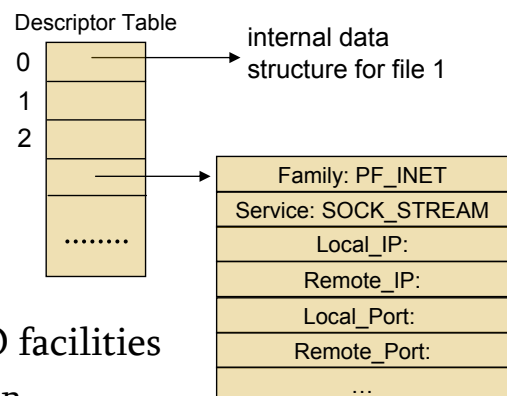

Berkley Sockets

- Universally known as **Sockets**
- It is an abstraction through which an application may send and receive data
- Provide **generic access** to interprocess communication services
 - e.g. IPX/SPX, Appletalk, TCP/IP
- Standard API for networking

Sockets

- Uniquely identified by
 - an internet address
 - an end-to-end protocol (e.g. TCP or UDP)
 - a port number
- Two types of (TCP/IP) sockets
 - **Stream** sockets (e.g. uses TCP)
 - provide reliable byte-stream service
 - **Datagram** sockets (e.g. uses UDP)
 - provide best-effort datagram service
 - messages up to 65.500 bytes
- Sockets extend the conventional UNIX I/O facilities
 - file descriptors for network communication
 - extended the read and write system calls

Sockets

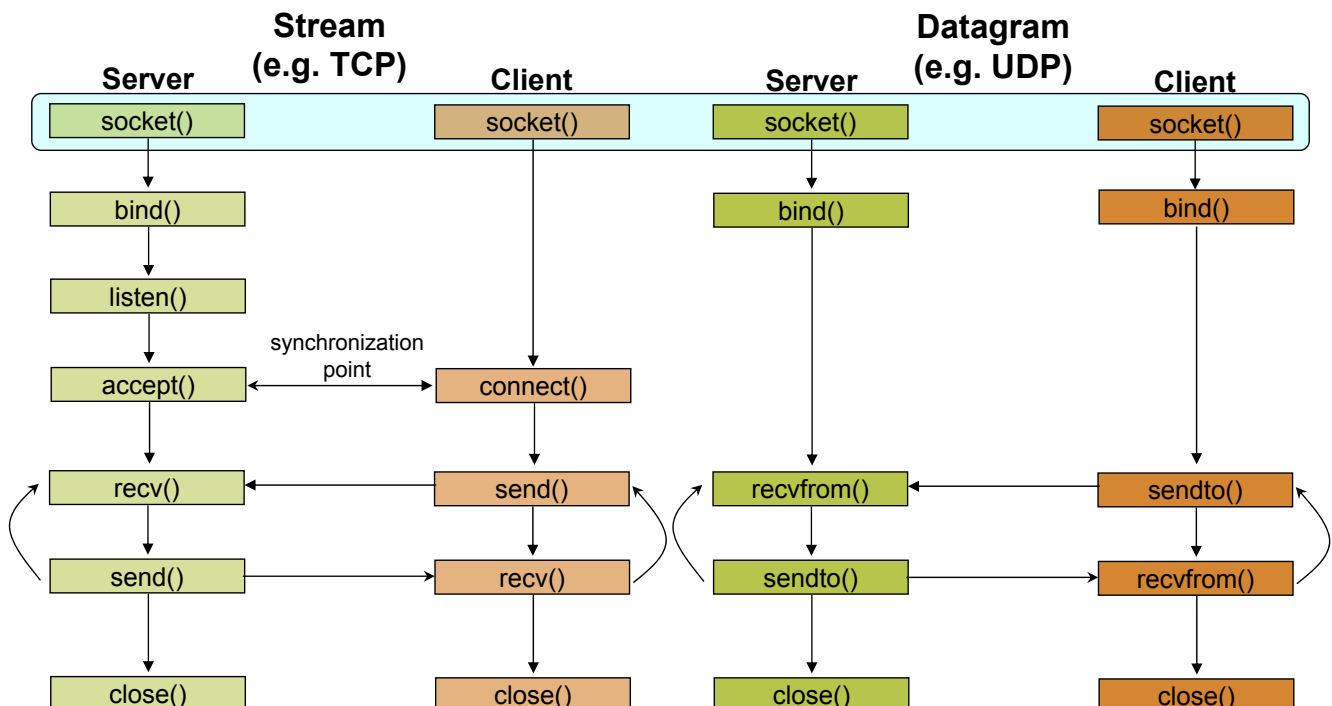

Client-Server communication

- **Server**
 - passively waits for and responds to clients
 - **passive** socket
- **Client**
 - initiates the communication
 - must know the address and the port of the server
 - **active** socket

Sockets - Procedures

Primitive	Meaning
Socket	Create a new communication endpoint
Bind	Attach a local address to a socket
Listen	Announce willingness to accept connections
Accept	Block caller until a connection request arrives
Connect	Actively attempt to establish a connection
Send	Send some data over the connection
Receive	Receive some data over the connection
Close	Release the connection

Client - Server Communication - Unix

Socket creation in C: `socket()`

- `int sockid = socket(family, type, protocol);`
 - **sockid**: socket descriptor, an integer (like a file-handle)
 - **family**: integer, communication domain, e.g.,
 - PF_INET, IPv4 protocols, Internet addresses (typically used)
 - PF_UNIX, Local communication, File addresses
 - **type**: communication type
 - SOCK_STREAM - reliable, 2-way, connection-based service
 - SOCK_DGRAM - unreliable, connectionless, messages of maximum length
 - **protocol**: specifies protocol
 - IPPROTO_TCP IPPROTO_UDP
 - usually set to 0 (i.e., use default protocol)
 - upon failure returns -1
- 👉 NOTE: socket call does not specify where data will be coming from, nor where it will be going to – it just creates the interface!

Assign address to socket: `bind()`

- associates and reserves a port for use by the socket
- `int status = bind(sockid, &addrport, size);`
 - **sockid**: integer, socket descriptor
 - **addrport**: struct `sockaddr`, the (IP) address and port of the machine
 - for TCP/IP server, internet address is usually set to `INADDR_ANY`, i.e., chooses any incoming interface
 - **size**: the size (in bytes) of the `addrport` structure
 - **status**: upon failure -1 is returned

bind() - Example with TCP

```
int sockid;
struct sockaddr_in addrport;
sockid = socket(PF_INET, SOCK_STREAM, 0);

addrport.sin_family = AF_INET;
addrport.sin_port = htons(5100);
addrport.sin_addr.s_addr = htonl(INADDR_ANY);
if(bind(sockid, (struct sockaddr *) &addrport, sizeof(addrport)) != -1) {
    ...}
```

Assign address to socket: bind()

- Instructs TCP protocol implementation to listen for connections
- `int status = listen(sockid, queueLimit);`
 - **sockid**: integer, socket descriptor
 - **queueLen**: integer, # of active participants that can “wait” for a connection
 - **status**: 0 if listening, -1 if error
- `listen()` is **non-blocking**: returns immediately
- The listening socket (sockid)
 - is never used for sending and receiving
 - is used by the server only as a way to get new sockets

Establish Connection: connect ()

- The client establishes a connection with the server by calling `connect ()`
- ```
int status = connect(sockid, &foreignAddr, addrlen);
```

  - **sockid**: integer, socket to be used in connection
  - **foreignAddr**: struct sockaddr: address of the passive participant
  - **addrlen**: integer, sizeof(name)
  - status: 0 if successful connect, -1 otherwise
- `connect ()` is **blocking**

---

## Incoming Connection: accept ()

- The server gets a socket for an incoming client connection by calling `accept ()`
- ```
int s = accept(sockid, &clientAddr, &addrlen);
```

 - **s**: integer, the new socket (used for data-transfer)
 - **sockid**: integer, the orig. socket (being listened on)
 - **clientAddr**: struct sockaddr, address of the active participant
 - filled in upon return
 - **addrlen**: sizeof(clientAddr): value/result parameter
 - must be set appropriately before call
 - adjusted upon return
- `accept ()`
 - is **blocking**: waits for connection before returning
 - dequeues the next connection on the queue for socket (sockid)

Exchanging data with stream socket

- `int count = send(sockid, msg, msgLen, flags);`
 - ❑ `msg`: const void[], message to be transmitted
 - ❑ `msgLen`: integer, length of message (in bytes) to transmit
 - ❑ `flags`: integer, special options, usually just 0
 - ❑ `count`: # bytes transmitted (-1 if error)
- `int count = recv(sockid, recvBuf, bufLen, flags);`
 - ❑ `recvBuf`: void[], stores received bytes
 - ❑ `bufLen`: # bytes received
 - ❑ `flags`: integer, special options, usually just 0
 - ❑ `count`: # bytes received (-1 if error)
- Calls are **blocking**
 - ❑ returns only after data is sent / received

Socket close in C: `close()`

- When finished using a socket, the socket should be closed
- `status = close(sockid);`
 - ❑ `sockid`: the file descriptor (socket being closed)
 - ❑ `status`: 0 if successful, -1 if error
- Closing a socket
 - ❑ closes a connection (for stream socket)
 - ❑ frees up the port used by the socket

Example - Echo using stream socket

```
/* Create socket for incoming connections */  
if ((servSock = socket(PF_INET, SOCK_STREAM, IPPROTO_TCP)) < 0)  
    DieWithError("socket() failed");
```

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. Close the connection

Server

1. **Create a TCP socket**
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. Accept new connection
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
echoServAddr.sin_family = AF_INET; /* Internet address family */  
echoServAddr.sin_addr.s_addr = htonl(INADDR_ANY); /* Any incoming interface */  
echoServAddr.sin_port = htons(echoServPort); /* Local port */  
  
if (bind(servSock, (struct sockaddr *) &echoServAddr, sizeof(echoServAddr)) < 0)  
    DieWithError("bind() failed");
```

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. **Assign a port to socket**
3. Set socket to listen
4. Repeatedly:
 - a. Accept new connection
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
/* Mark the socket so it will listen for incoming connections */  
if (listen(servSock, MAXPENDING) < 0)  
    DieWithError("listen() failed");
```

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. **Set socket to listen**
4. Repeatedly:
 - a. Accept new connection
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
for (;;) /* Run forever */  
{  
    clntLen = sizeof(echoClntAddr);  
  
    if ((clientSock=accept(servSock, (struct sockaddr *)&echoClntAddr, &clntLen))<0)  
        DieWithError("accept() failed");  
    ...  
}
```

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

Server is now blocked waiting for connection from a client

...

A client decides to talk to the server

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
/* Create a reliable, stream socket using TCP */  
if ((clientSock = socket(PF_INET, SOCK_STREAM, IPPROTO_TCP)) < 0)  
    DieWithError("socket() failed");
```

Client

1. **Create a TCP socket**
2. Establish connection
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
echoServAddr.sin_family = AF_INET;           /* Internet address family */
echoServAddr.sin_addr.s_addr = inet_addr(echoServIP); /* Server IP address */
echoServAddr.sin_port = htons(echoServPort); /* Server port */

if (connect(clientSock, (struct sockaddr *) &echoServAddr,
            sizeof(echoServAddr)) < 0)
    DieWithError("connect() failed");
```

Client

1. Create a TCP socket
2. **Establish connection**
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

Server's accept procedure is now unblocked and returns client's socket

```
for (;;) /* Run forever */
{
    clntLen = sizeof(echoClntAddr);

    if ((clientSock=accept(servSock, (struct sockaddr *) &echoClntAddr, &clntLen)) < 0)
        DieWithError("accept() failed");
    ...
}
```

Client

1. Create a TCP socket
2. **Establish connection**
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
echoStringLen = strlen(echoString); /* Determine input length */  
  
/* Send the string to the server */  
if (send(clientSock, echoString, echoStringLen, 0) != echoStringLen)  
    DieWithError("send() sent a different number of bytes than expected");
```

Client

1. Create a TCP socket
2. Establish connection
3. **Communicate**
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection

Example - Echo using stream socket

```
/* Receive message from client */  
if ((recvMsgSize = recv(clntSocket, echoBuffer, RCVBUFSIZE, 0)) < 0)  
    DieWithError("recv() failed");  
/* Send received string and receive again until end of transmission */  
while (recvMsgSize > 0) { /* zero indicates end of transmission */  
    if (send(clientSocket, echobuffer, recvMsgSize, 0) != recvMsgSize)  
        DieWithError("send() failed");  
    if ((recvMsgSize = recv(clientSocket, echoBuffer, RCVBUFSIZE, 0)) < 0)  
        DieWithError("recv() failed");  
}
```

Client

1. Create a TCP socket
2. Establish connection
3. **Communicate**
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. Accept new connection
 - b. **Communicate**
 - c. Close the connection

Example - Echo using stream socket

Similarly, the client receives the data from the server

Client

1. Create a TCP socket
2. Establish connection
3. **Communicate**
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. Accept new connection
 - b. **Communicate**
 - c. Close the connection

Example - Echo using stream socket

```
close(clientSock);
```

```
close(clientSock);
```

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. **Close the connection**

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. Accept new connection
 - b. Communicate
 - c. **Close the connection**

Example - Echo using stream socket

Server is now blocked waiting for connection from a client

...

Client

1. Create a TCP socket
2. Establish connection
3. Communicate
4. Close the connection

Server

1. Create a TCP socket
2. Assign a port to socket
3. Set socket to listen
4. Repeatedly:
 - a. **Accept new connection**
 - b. Communicate
 - c. Close the connection
